

MW Campaign on the blazar Markarian 501

March – May 2008

Reduction of the data and submission to the archive “finished” by February 2009

Some instruments are still missing... but we have to move on (with or without them)

Several of us working on synthesizing info from the pool of data and extract physics from it.

While working on the data, we noticed several bugs (typos, analysis problems...) in the data reduction of various instruments.

We are contacting the “data analyzers” and they provide us with new corrected files. This week, updated the data archive several times.
Hopefully the rate of data-updates will asymptotically go to zero within the next days....

This is the 1st virtual meetings to discuss about interpretation of the reduced data. We’ll have another one in 2 weeks from now (~ April 22-24). Hopefully we can converge and fix the contents of the paper in 2-3 meetings (1-1.5 months)
