# Outline of This Talk

---

- The GLAST Large Area Telescope (pp. 3,4)
- Overview of Cosmic Ray (pp. 5, 6)
- Cosmic-rays in low-earth orbit (pp. 7-11)
- Cosmic-rays in balloon altitude (pp. 12-14)
- Documents and source codes (p. 15)
- GLAST Balloon Experiment (pp. 16,17)
- GLAST BFEM data (pp. 18-22)
- Summary (p.23)

# GLAST Large Area Telescope

**TKR(U.S.A., Japan, Italy):**  
**Si-Strip Tracker with Lead converter**  
 18 X-Y tracking planes,  
 228um pitch,  $8 \times 10^5$  channels

- Identification of gamma
- Measure gamma-ray direction

**GLAST (Gamma-ray Large Area Space Telescope)=LAT+GBM**

**LAT: Large Area Telescope**

4X4=16 towers  
 3000kg, 650 W,  $1.8 \times 1.8 \times 1 \text{m}^3$   
 (30MeV-300GeV)

**ACD(U.S.A.):**  
**Segmented 89 plastic scintillator tiles**

- Eliminate background due to charged particle
- Segmentation: prevent self-veto in high energy

**CAL(U.S.A., France, Sweden):**  
**Hodoscopic array of 1536 CsI(Tl) scintillators (8 layers in each tower)**

- Energy measurement

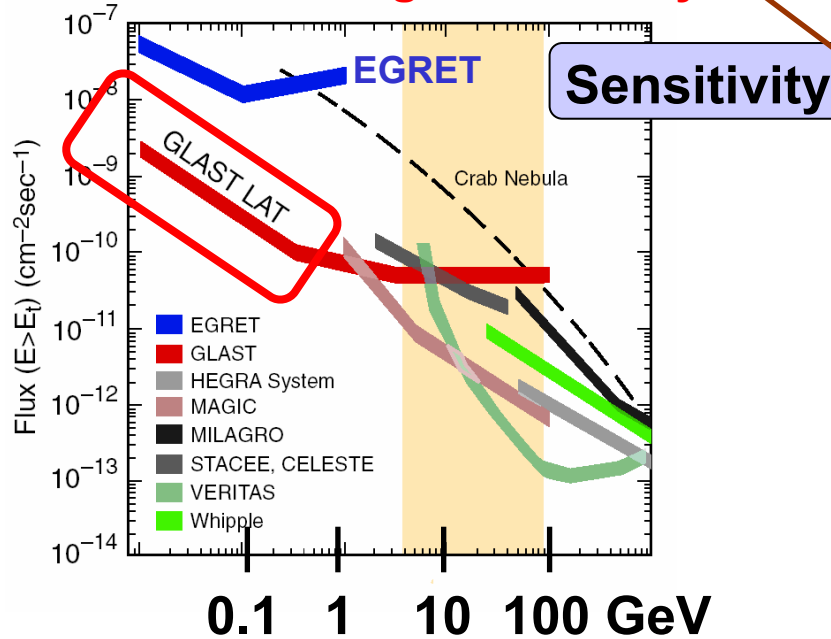

# GLAST Performance

## GLAST Large Area Telescope

- wide FOV (~2sr, 20% of all-sky)
- high angular resolution (10' in E>10 GeV)
- large effective area (~10000 cm<sup>2</sup>)

**High Sensitivity**

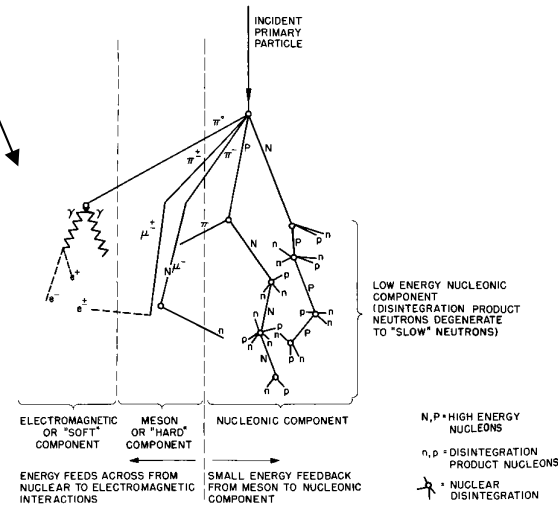

• To estimate the trigger rate and to eliminate the background in orbit, we need to know the **cosmic-ray background environment**.

# Overview of CR Environment (1)

- Charged **primary cosmic-rays**, generated in extraterrestrial space, are decelerated by solar wind (**solar modulation**)
- Primary charged CRs are affected by earth magnetic field (**geomagnetic cutoff**, east-west effect)
- Secondary CRs** are generated in earth atmosphere

- Primary: high energy (above geomag. cutoff)
- Secondary: low energy (below cutoff)
- Both primary and secondary depend on geomag. cutoff

Schematic Diagram of Cosmic Ray Shower

## Overview of CR Environment (2)

---

- Protons

- Primary: fluxes are similar in balloon altitude and low-earth orbit (small difference due to attenuation by air: ~5% at 3.8g/cm<sup>2</sup>)
- Secondary: fairly different (Larmor radius is much smaller than satellite altitude )

- Alpha primary: fluxes are similar

- Electron/positrons

- Primary: fluxes are similar (small difference due to energy loss in air, ~10% at 3.8g/cm<sup>2</sup>)
- Secondary: fairly different

- Gamma

- Primary: fluxes are similar (except for energy dependent attenuation by air)
- Secondary downward: only in balloon altitude
- Secondary upward: fluxes are similar (small difference due to the different solid angle of earth atmosphere)

- Muons: only in balloon altitude

Fluxes in balloon altitude and low-earth are similar to each other:

➡ **GLAST Balloon Experiment**

# Primary Charged Particle Spectra

- Primary spectra before being affected by modulation

$$\text{Unmod}(E) = A \times \left( \frac{R(E)}{\text{GV}} \right)^{-a}$$

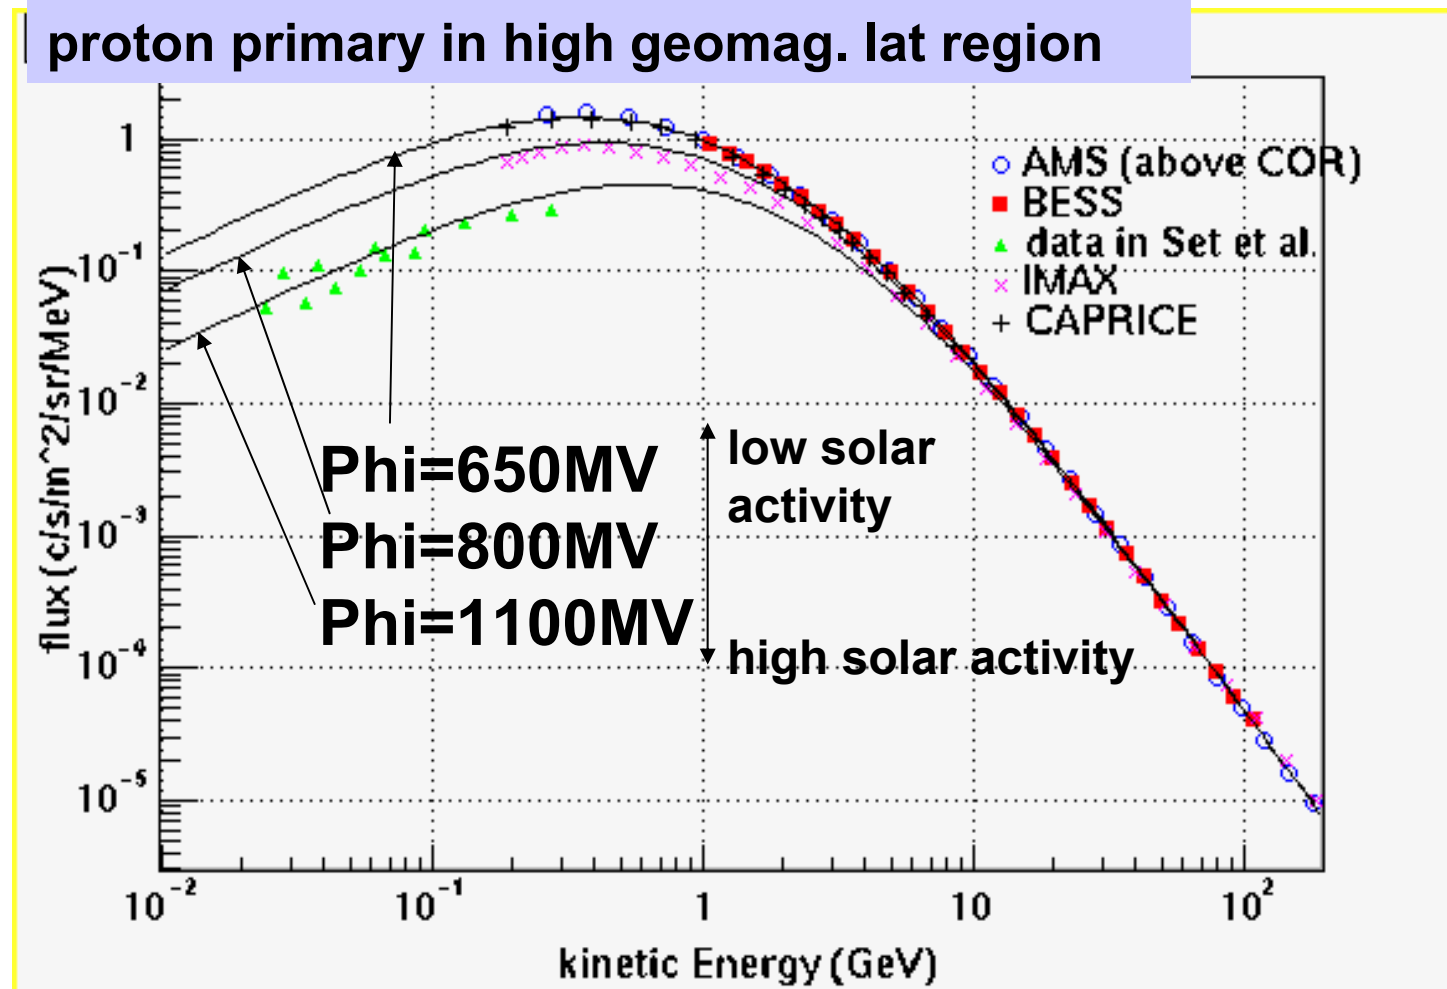

$$\text{Primary}(E) = \text{Unmod}(E + e\Phi) \times \frac{(E)^2 - (Mc^2)^2}{(E + e\Phi)^2 - (Mc^2)^2} \times \frac{1}{1 + \left( \frac{R}{R_{\text{cutoff}}} \right)^{-r}}$$

- Solar modulation formula given by Gleeson and Axford (1968)

- Our reduction factor to reproduce the geomagnetic cutoff in AMS data.
- A parameter  $r=12.0$  for proton/alpha and  $6.0$  for electron/positron.

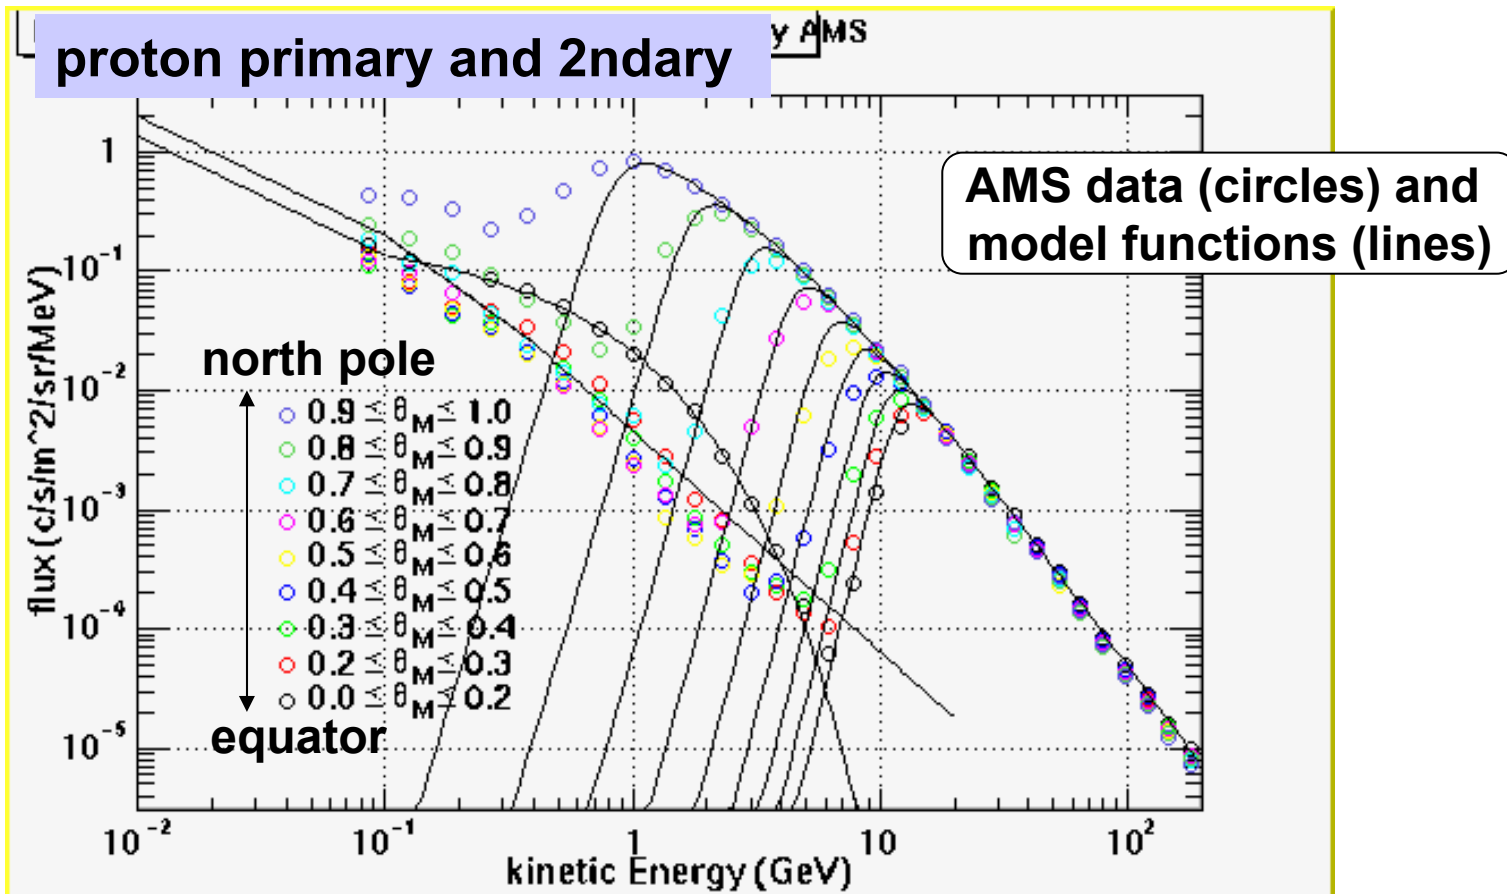

# Proton Primary Spectra

Flux anticorrelates the solar activity, which was minimum in year 1996 (and so it will be in 2007)

# Proton Spectra in Low-Earth Orbit

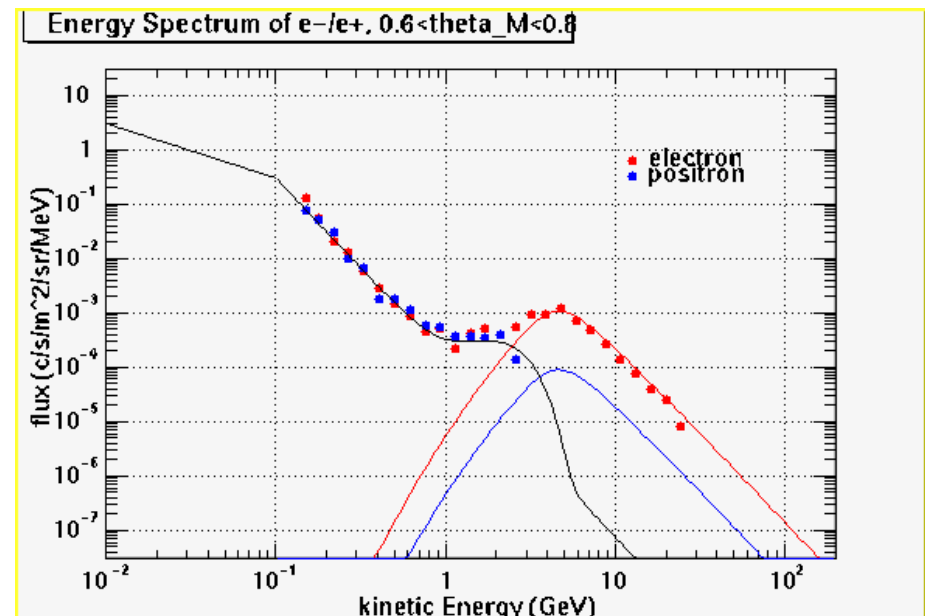

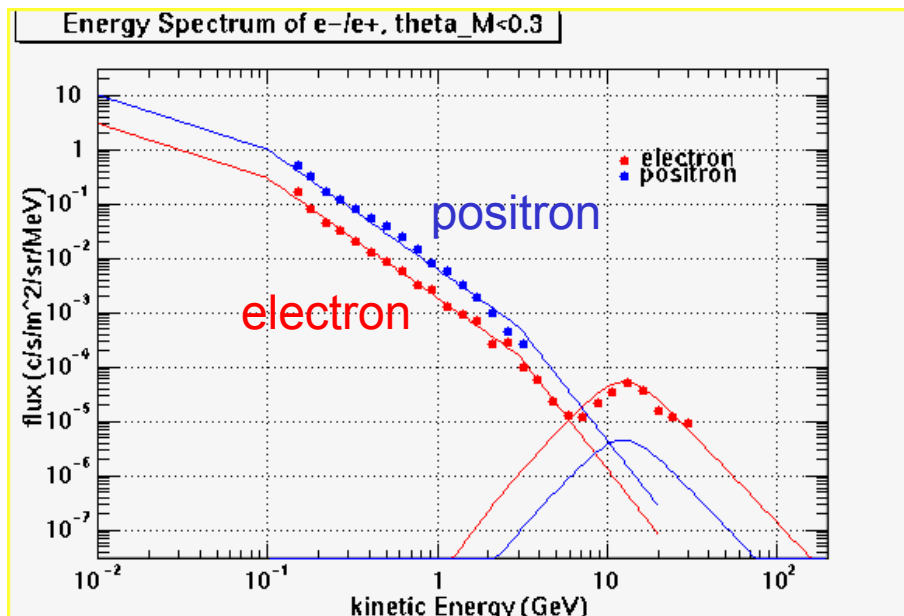

- Our model reproduces primary spectra except for high geomag. lat region.
- Secondary fluxes in AMS(@380km) could be somewhat higher than those in low-earth orbit (550km). Our model is a conservative estimate.
- Zenith angle distribution of 2ndary could be uniform (particles are confined by geomag. field).

# Electron/Positron Spectra in Low-Earth Orbit

## e-/e+ spectra in geomagnetic equator

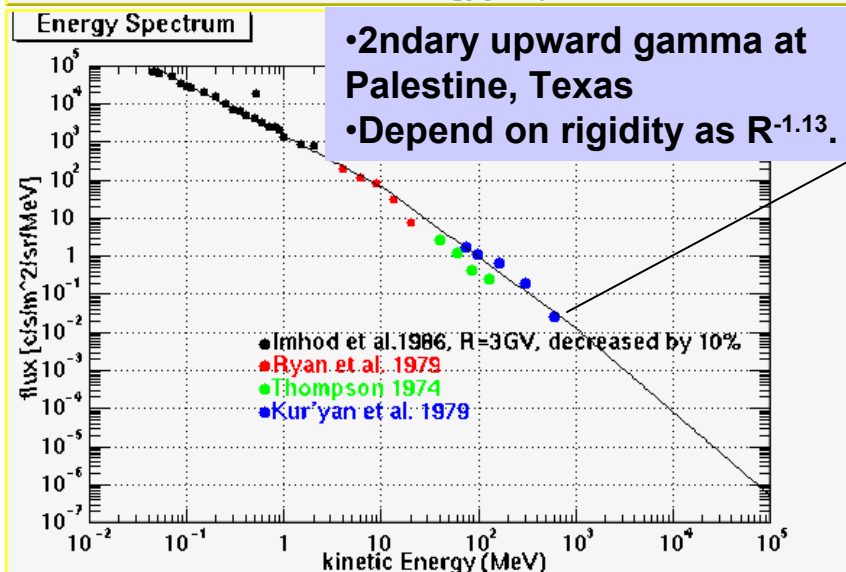

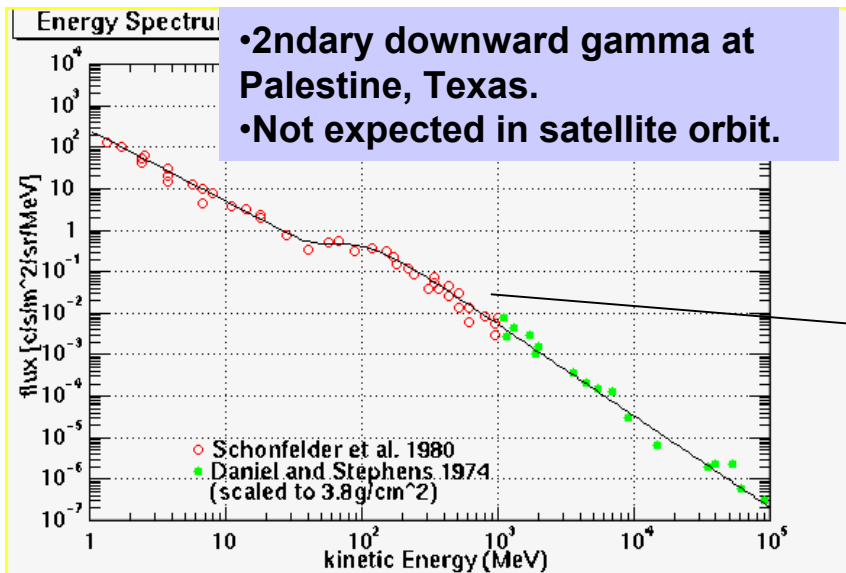

## e-/e+ spectra in high geomag. lat. region

- Low primary flux (large geomag. cutoff) ← → • high primary flux (small geomag. cutoff)
- High secondary flux, different in electron/positron. ← → • low secondary flux, similar in electron/positron.

# Gamma Spectra

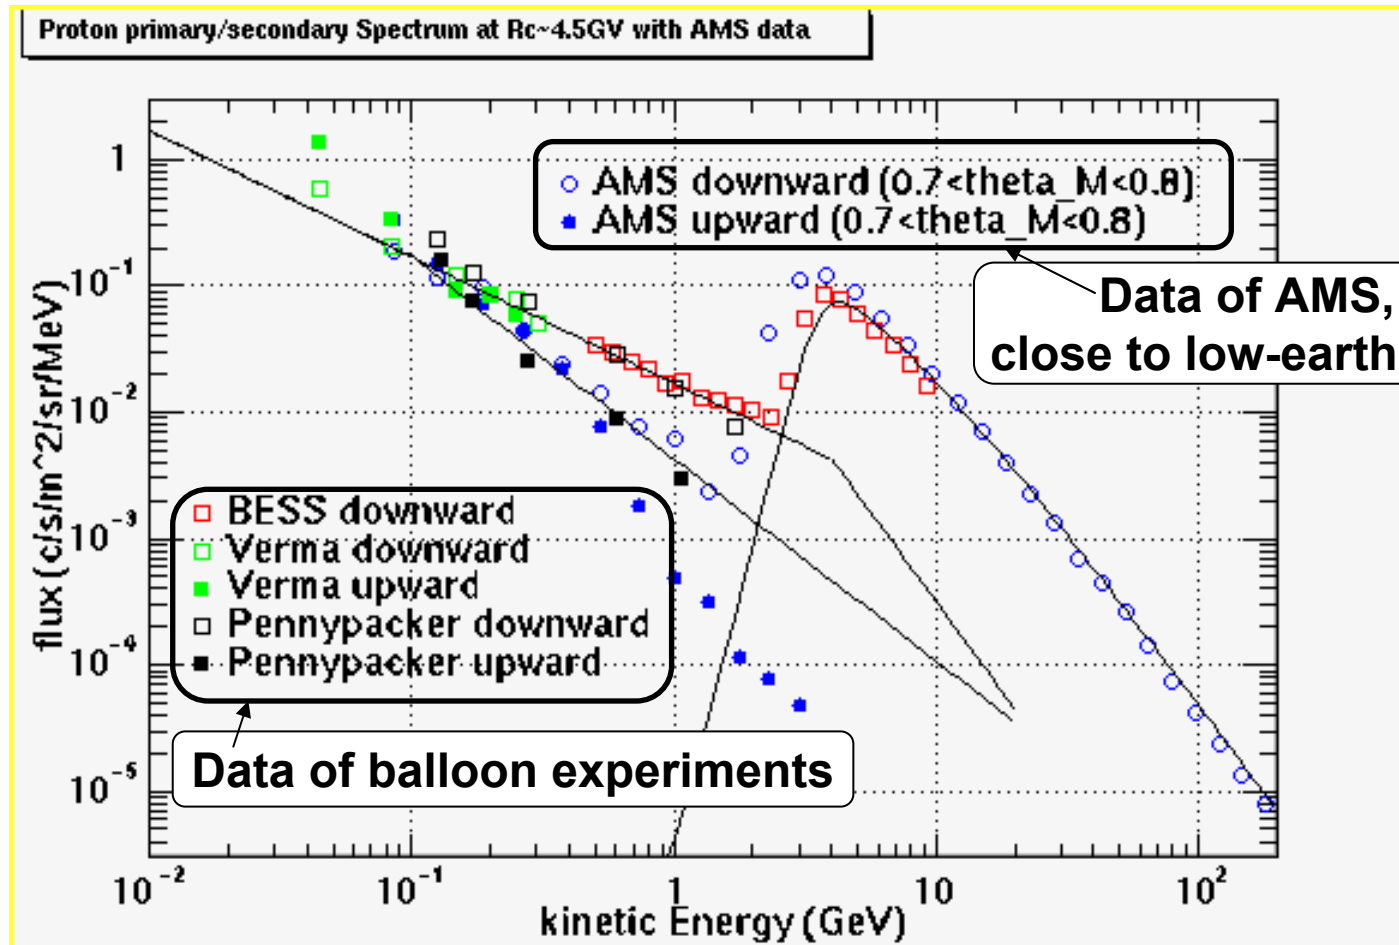

Upward flux in balloon altitude could be somewhat higher than that in satellite altitude. Our model gives a conservative estimate.

← Large uncertainty, need to be verified by GLAST Balloon Experiment

# Reference: Proton Spectra at Balloon Altitude

•Secondary flux in balloon altitude is much higher than that of low-earth orbit

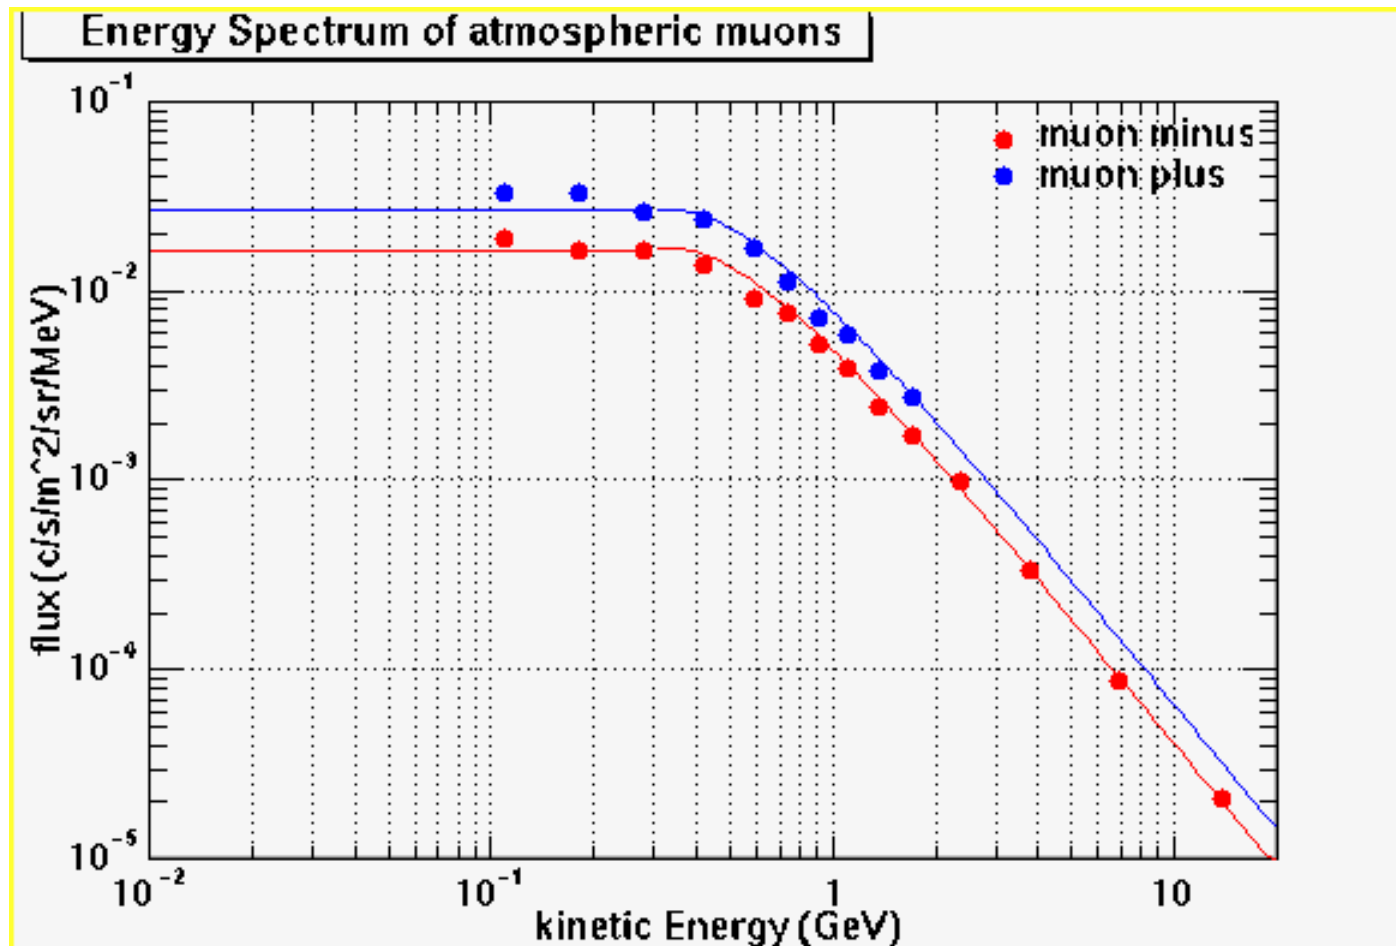

## Reference: e<sup>-</sup>/e<sup>+</sup> Spectra at Balloon Altitude

- Secondary flux in balloon altitude is much higher than that of low-earth orbit

## Reference: Muon Spectra at Balloon Altitude

## Documents and sour codes

---

- **Model description (paper accepted for publication by ApJ):**  
[http://www.slac.stanford.edu/~mizuno/GLAST/Balloon/BalloonAnalysis\\_ApJ\\_2004-06-28.pdf](http://www.slac.stanford.edu/~mizuno/GLAST/Balloon/BalloonAnalysis_ApJ_2004-06-28.pdf)
- **Summary of models (poster presented in meeting in Japan):**  
[http://www.slac.stanford.edu/~mizuno/GLAST/Presentation/CR\\_2004-03-23\\_poster.ppt](http://www.slac.stanford.edu/~mizuno/GLAST/Presentation/CR_2004-03-23_poster.ppt)
- **Source Codes (CRflux package):**  
glastpack.pl rco GlastRelease HEAD  
glastpack.pl rco CRflux HEAD  
glastpack.pl build CRflux  
glastpack.pl run CRflux test\_CRflux.exe  
(edit CRTTestAlg.cxx to choose particle type)

# The GLAST Balloon Experiment

## Balloon Flight Engineering Model (BFEM)

eXternal Gamma-ray Target(XGT)

ACD

TKR  
(inside)

CAL

Structure

D. Thompson et al., 2002

### Objectives:

- Validate the LAT design at the single tower level
- Show the ability to take data in a space-like high-counting environment.
- Collect cosmic-ray events to be used for a background database for LAT.

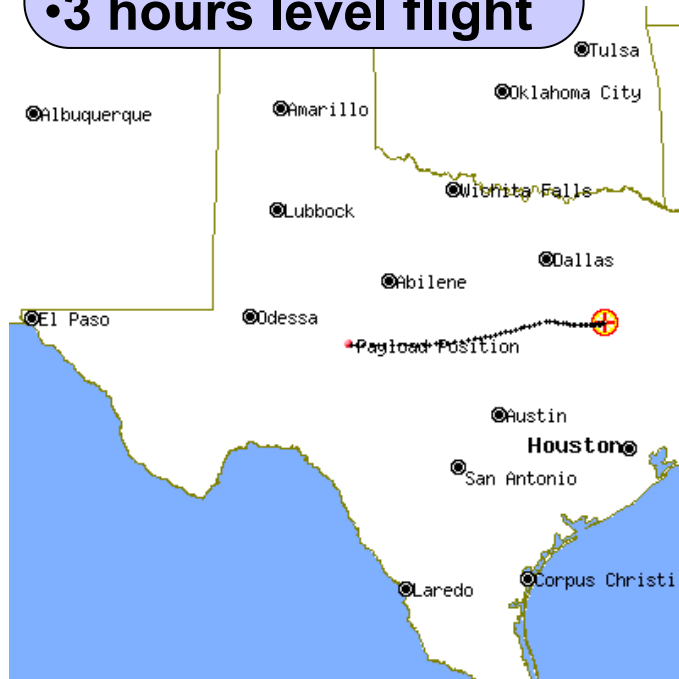

•We have developed cosmic-ray spectral models and an instrument simulator.

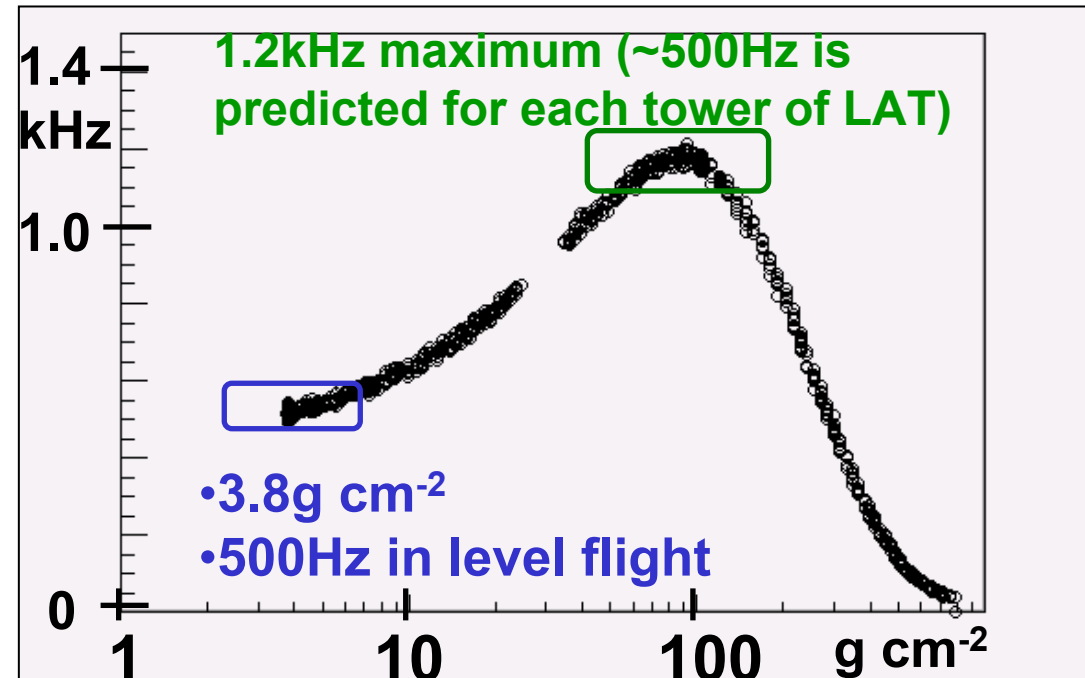

# Balloon Flight Operation

- August 4<sup>th</sup>, 2001
- @ Palestine, Texas
- 38km altitude
- 3 hours level flight

## Trigger rate vs. atmospheric depth

- All detector components worked well in high-counting environment.

- We collected over 100k events during level flight via telemetry. (~2.5% out of all triggered events)
- We compensated small bias in event sampling.

# Count Rate of Each Layer for “Charged Events” (Hit in ACD)

- trigger rate (data):  
~440Hz
- simulation total:  
~440Hz
- muon : 39 Hz
- gamma : 54 Hz
- e-/e+ : 110 Hz
- alpha : 19 Hz
- proton : 216 Hz

•Succeeded in reproducing data in all 26 Si layers

26 Si layers  
(13 planes: x-y pair)

# Angular Distribution of “Charged Events”

•Reproduce zenith angle distribution in region of  $\cos(\theta)=1.0-0.3$  (0-70degree)

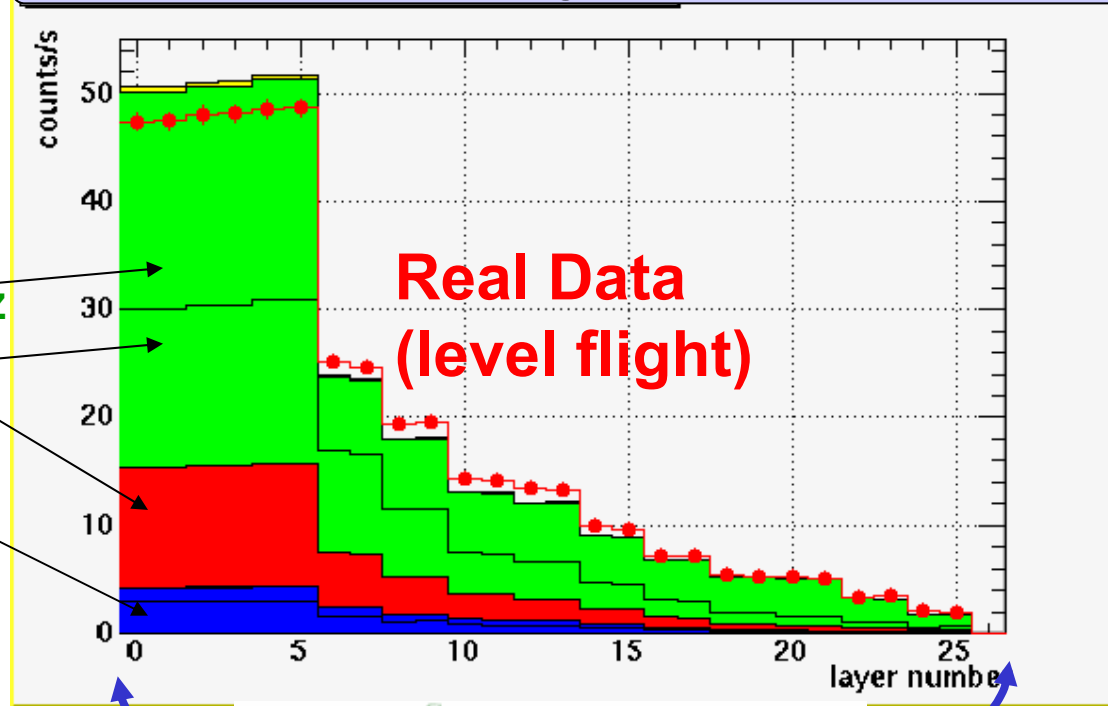

# Count Rate of Each Layer for “Neutral Events” (no Hit in ACD)

- trigger rate (data):  
~58Hz
- simulation total:  
~61Hz

- muon : 0.5Hz
- gamma upward : 26.8 Hz
- gamma downward: 16.8Hz
- e-/e+ : 12.3Hz
- alpha : 0.1Hz
- proton : 4.8Hz

Count rate of each layer for “Neutral Events”

•Succeeded in reproducing data in all 26 Si layers

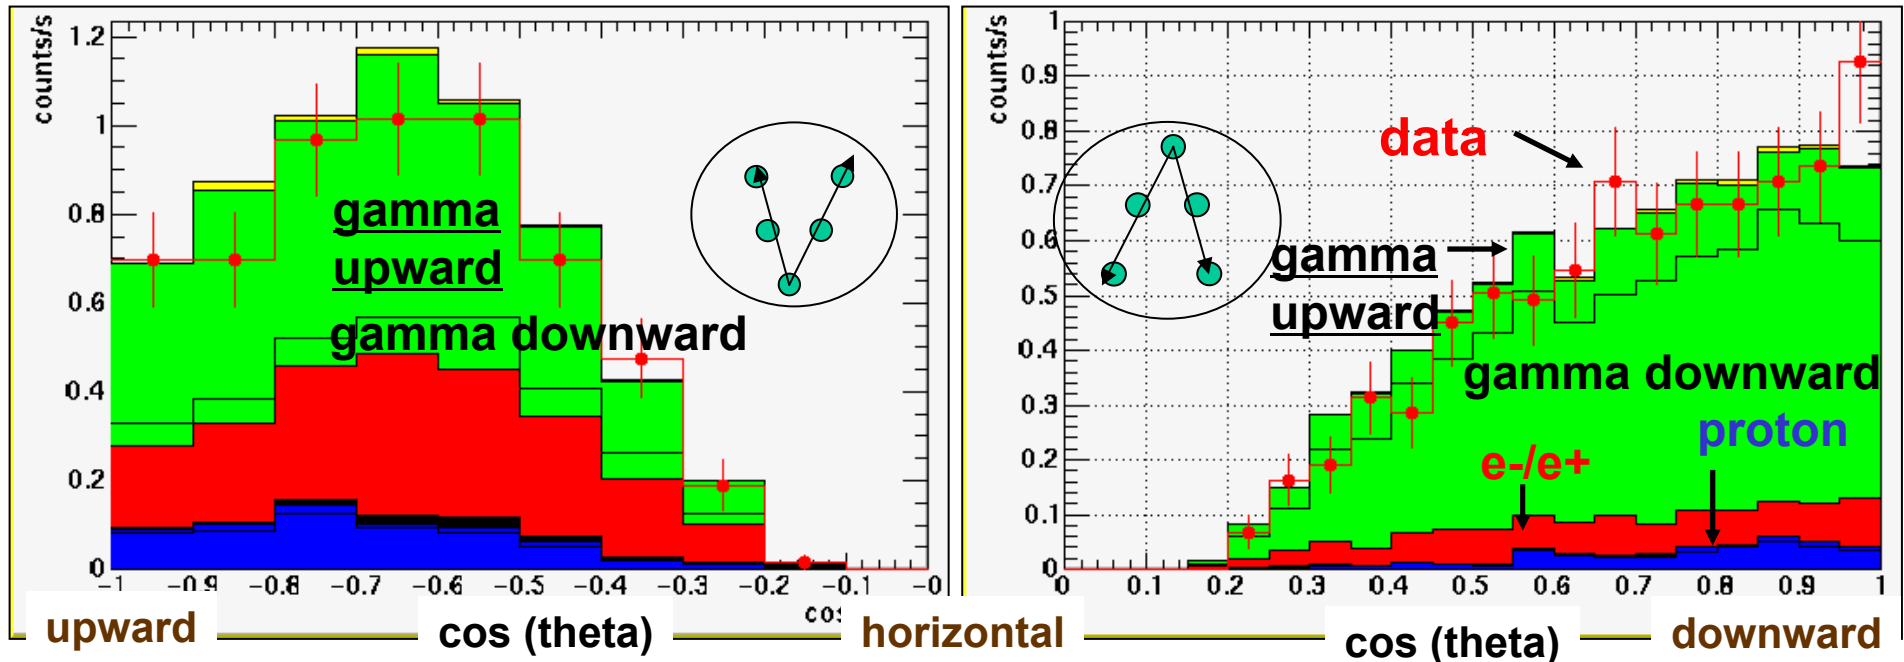

# Angular Distribution of atmospheric gamma

## Zenith angle distribution

gamma upward candidate

gamma downward candidate

•Succeeded in reproducing downward gamma in  $\cos(\theta)=1\sim 0.3$  (0-70degree) and upward gamma in  $\cos(\theta)=-1\sim -0.3$ (180-110degree)

➡ We verified atmospheric gamma-ray fluxes

# Importance of low-energy particles

Energy distribution of particles which trigger BFEM

2ndary electron

gamma upward

•  $e^-/e^+$  of  $\sim 100$  MeV and upward gammas below 100 MeV contribute to neutral events. We must eliminate those low energy particles by an on-line/off-line filtering in GLAST observation.

# Summary

---

- **Cosmic-Rays consists of the primary and secondary components**
  - **Primary: high energy, depend on solar modulation and geomag. cutoff**
  - **Secondary: low energy, depend on (solar modulation and) geomag. Cutoff**
- **We modeled proton, alpha, electron, positron, gamma in low-earth orbit by referring to existing measurements and theoretical predictions.**
- **Model descriptions and source codes are available.**
  - [http://www.slac.stanford.edu/~mizuno/GLAST/Balloon/BalloonAnalysis\\_ApJ\\_2004-06-28.pdf](http://www.slac.stanford.edu/~mizuno/GLAST/Balloon/BalloonAnalysis_ApJ_2004-06-28.pdf)
  - `Glastpack.pl rco CRflux HEAD`
- **We “validated” our model through analysis of BFEM data.**
- **Low energy ( $\leq 100\text{MeV}$ ) electron/positron/gamma significantly contribute to neutral events and we must eliminate them in GLAST observation.**
